ABSTRACTED-PUB-NO: WO 200010665A
BASIC-ABSTRACT:

NOVELTY - The doll has skeletal parts (7) buried in a trunk, arms (2) and legs (3). Each skeletal part has first metal cores (8) disposed at portions corresponding to joints and second hard-synthetic-resin cores (9) disposed at distal ends and portions between adjacent joints. The cores are connected together, with first cores covered with synthetic resin (6a) as required. Skeletons are covered with skin-muscle members (6) made of soft synthetic resin.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a method for manufacturing the doll.

USE - For child's play.

ADVANTAGE - Can be deformed in a natural shape by being bent at portions to be bent. Can be downsized.

DESCRIPTION OF DRAWING(S) - The figure shows a cross-section through the doll.

ABSTRACT:

PROBLEM TO BE SOLVED: To integrally mold a connecting device connected click-operably and integrally mold a moving body incorporated with the connecting device.

SOLUTION: A torso section 303 having shoulder connection sections 305 and lower arm sections 311 having elbow connection sections 313 are molded with the first synthetic resin raw material A in the first molding process. Shoulder hold sections 323 holding the shoulder connection sections of the torso section 303 and upper arm sections 321 having elbow hold sections 325 holding the elbow connections 313 of lower arm sections 311 are integrally molded with the second synthetic resin raw material B in the second process. Covering member covering the torso section 303, lower arm sections 311, and upper arm sections 321 molded in the first and second processes are integrally molded with a synthetic resin raw material C in the third process.

ABSTRACT:

PURPOSE: To provide a manufacturing method of a plastic doll in which the number of parts and assembly manhour are reduced drastically by integrally molding the parts which constitute joint parts in molding and carrying out integral molding in the connection state of a trunk part, arm part, leg part, etc., having the above-described integral molded part as insertion part.

CONSTITUTION: A manufacturing process for a plastic doll consists of the first molding process in which a trunk part 1 having spherical joint parts 4 and 5, intermediate joint shaft 23 having a hinge joint part 23a, hand part 24 having a spherical joint part 25, knee joint shaft 33 having each hinge joint part 33a at both the edges, and a leg joint part 35 having a spherical joint part 35a are integrally molded and the second molding process in which an arm part 2 is developed laterally for the trunk part 1, having the molded part as insertion part, and both the crotches of the leg part 3 are integrally molded, being pushing-spread laterally.

ABSTRACTED-PUB-NO: DE 19722820A
BASIC-ABSTRACT:

The assembly comprises a first part made of synthetic resin with integral connecting part on the outer surface of which are protuberances. A second part made of a second synthetic resin has an integrally moulded attachment part enclosing the outer surface of the connecting part. The first part is movable in relation to the second part.

The two parts are enclosed in a third, elastic part made of a third synthetic resin. The movable body comprises a torso with integral hip joint part from the outer surface of which protrude protuberances. A lower leg has an integral knee joint part from the outer surface of which protrude protuberances. A thigh has an integral hip joint part and integral knee joint part.

ADVANTAGE - The connected component can execute a locking motion and can be incorporated in a movable body.

ABSTRACTED-PUB-NO: JP05208077A

BASIC-ABSTRACT:

Method comprises (1) integrally moulding the body having spherical joints,

intermediate joint shafts having a hinge joint, hands having a spherical joint, knee joint shafts having a hinge joint and leg joint shafts having a spherical joint into a joint component, and (2) after placing the joint component as an insert in another mould, adding another material having a lower m.pt. and greater thermal contraction with arms extended laterally against the body and both crotches of the legs opened laterally.

ADVANTAGE - Capable of extensively reducing the number of parts and the number of the assembly steps.
